

Figure 1.1. The physical photo of ATH10KR8B

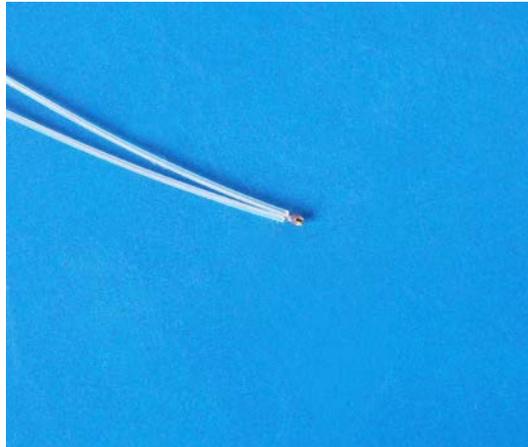

Figure 1.2 The physical photo of ATH10KR8BT65

MAIN FEATURES

- Glass Encapsulated for Long Term Stability & Reliability
High Stability: <0.1°C/Y
Small Size: φ0.8mm×1.4mm
High Resistance Accuracy: 1%
Short Response Time
Wide Temp. Range: -55°C to 250°C
100 % Lead (Pb)-free and RoHS Compliant

APPLICATIONS

Temperature sensing for laser diodes, optical components, etc.

DESCRIPTION

The ATH10KR8B series thermistor is consisted of three versions, ATH10KR8B as shown in Figure 1.1, ATH10KR8BT65 shown in Figure 1.2 and ATH10KR8BT65S. The ATH10KR8B has bear leads coated with copper, the ATH10KR8BT65S has the leads covered by high temperature plastic tubing and sealed by epoxy, while the ATH10KR8BT65 is the non-sealed version.

Note: This thermistor ATH10KR8B is a replacement for ATH10KR8.

The ATH10KR8B is a high precision glass encapsulated thermistor. Comparing with conventional epoxy encapsulated thermistors, ATH10KR8B presents higher long term stability and wider temperature range. In addition, it has a small size and short response time. In addition, there are two insulation versions available, one of which comes with leads covered by plastic tubing, the ATH10KR8BT65, and the other one, the ATH10KR8BT65S, is sealed between the head and the tubing. They can work under up to 140°C temperature and the latter is of liquid resistant.

The ATH10KR8B series can be used to measure the temperatures for laser diodes, optical components, etc., with high accuracy and long term stability.

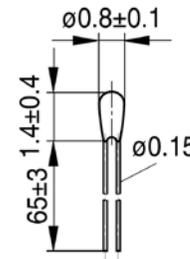

Figure 2. Side View of ATH10KR8B

SPECIFICATIONS

Table with 3 columns: Parameters, ATH10KR8B, and ATH10KR8. Rows include Nominal Resistance @ 25°C, B Value @ 25°C/85°C, B Value @ 0°C/100°C, B Value @ 25°C/100°C, Thermistor Diameter, Thermistor Length, Lead Diameter, Lead Length, Dissipation Factor, Heat Capacity, Maximum Power @ 25°C, and Time Constant.

APPLICATION

Drill a hole on the object for which the temperature needs to be measured and use thermally conductive epoxy to pot the thermistor inside the hole. The hole diameter should be between 1.2 to 1.4mm and the depth should between 2 to 2.5mm. When a deeper hole is needed, drill a 2 stage hole to prevent mounting epoxy bobbles trapped inside which would

cause temperature measurement errors. Figure 3 shows the section view of the 2 stage hole.

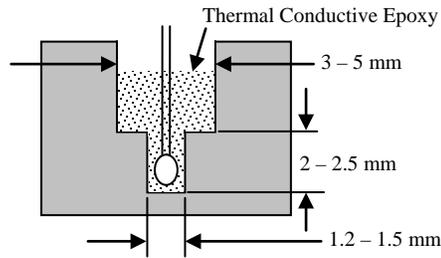

Figure 3. Section View of the 2 Stage Hole

The worst mounting result is that there are air bubbles trapped inside the thermistor mounting hole. These bubbles cause thermal sensing time delay and sensing temperature

Resistance Temperature Characteristics

errors. To avoid the bubbles, use thin epoxy, vibrate the assembly before curing, and cure the epoxy inside the mounting hole at high temperature, 80°C to 150°C, depending on the epoxy used and the maximum temperature assembly components allow.

The thermistor lead wires are made of plain copper and there is no insulation coating on them, please make sure that they do not touch each other after mounting the thermistor.

Some thermal conductive epoxies are also electrically conductive and such epoxies should not be used for mounting the thermistors, since the lead wires are conductive.

Notice: Glass encapsulated cannot be used in water or other liquid directly.
